

# Environment and Energy

## Charlie - Delta Increments

### Portfolio Overview

The environmental vision for the FAA's strategic plan is to develop and operate a system that reduces aviation's environmental and energy impacts to a level that does not constrain growth and is a model of sustainability. Aircraft noise, air quality, climate, and energy are the most significant potential environmental constraints to increasing aviation capacity, efficiency, and flexibility. Limiting and reducing future aviation environmental impacts to levels that protect public health and welfare as well as ensuring energy availability and sustainability are the guiding principles of aviation environmental protection. The FAA is pursuing the following environmental goals:

**Noise:** Reduce the number of people exposed to significant noise around U.S. airports in absolute terms, notwithstanding aviation growth, and provide additional measures to protect public health and welfare and national resources.

**Air Quality:** Achieve an absolute reduction of significant air quality health and welfare impacts attributable to aviation.

**Climate:** Limit the impact of aircraft carbon dioxide (CO2) emissions on the global climate by achieving carbon-neutral growth by 2020 compared to 2005, and net reductions of the climate impact from all aviation emissions over the longer term (by 2050).

**Energy:** Improve National Airspace System (NAS) energy efficiency and develop and deploy alternative jet fuels for commercial aviation.

To achieve these goals, the FAA's environmental and energy research strategy is based on characterization of the problem and assessment of associated risks; development of technological and policy based solutions; and management of system-wide performance while working closely with stakeholders community. The FAA Office of Environment and Energy is pursuing 5-pillar approach to meet environmental goals (1) Improve scientific knowledge and enhance integrated environmental modeling capability; (2) accelerate maturation of new aircraft technologies; (3) advance alternative jet fuels; (4) explore air traffic management modernization and operational improvements; and (5) develop policies, environmental standards, and market based measures. The Operational Improvements, enabling activities and increments reflect this strategy.

Activities in this portfolio will be conducted in such a way that they do not impact the safety of the NAS. In the Bravo timeframe this portfolio will build on progress from the enabling activities in the Alpha timeframe, which includes Phase 2 maturation of environmentally friendly technologies, fuels, and continued focus on environmental and energy-favorable concepts and operations.

Note: The dates and timelines included in the NAS Segment Implementation Plan (NSIP) are for planning purposes only. All capability schedules are tentative until their supporting programs are officially baselined.

## Increments/Enabling Activities

**C** [701104-01] Aviation Environmental Tools Suite - Phase III (2021 - 2025)

### Increment Overview

Develop, evaluate, and implement additional Phase III enhancements to the aviation environmental suite of tools that range from aircraft level to NAS-wide modeling and analyses to inform development of mitigation solutions and policy options that will further improve scientific knowledge, refine metrics, and reduce uncertainties of aircraft source-level noise and emissions of air pollutants and greenhouse gases, their atmospheric evolution, and impacts on human health and welfare and climate change.

### Increment Status

Concept Exploration & Maturation

### Success Criteria

2025 : Use of advanced scientific understanding of aviation noise and emissions and their impacts, to enhance capability of environmental assessment models to assess environmental performance and benefits of mitigation options.

### Implementation Approach

Release enhanced versions of AEDT and develop additional analytical capabilities to support decision-making, environmental performance assessments, and cost-benefit analyses.

#### Benefits

- Access & Equity
- Capacity
- Flexibility
- Efficiency
- Environment
- Predictability
- Safety

Environment (P): Integrated advancement in scientific knowledge and environmental analytical tools capability will provide solid foundation for environmental mitigation (technological and policy based) decision-making and assessment studies.

## OI: [702104] NextGen Environmental Engine and Aircraft Technologies - Phase III (2021 - 2026)

Develop and mature aircraft and engine technologies to reduce noise, emissions, and fuel burn from commercial subsonic jet aircraft through the FAA's Continuous Lower Energy, Emissions, and Noise (CLEEN) program. Demonstrate these technologies at sufficient readiness levels to achieve goals of the CLEEN Phase III program.

### OI Benefit

Environment (P): Reduce emissions, fuel burn, and noise.

## Increments/Enabling Activities

**C** [702104-01] Explore and Demonstrate New Technologies Under CLEEN - Phase III (2021 - 2026)

### Increment Overview

This enabling activity will mature and demonstrate new environmentally beneficial aircraft technologies in CLEEN Phase III.

### Increment Status

Concept Exploration & Maturation

### Success Criteria

- ✓ 2022 : Complete GE low emissions combustor rig testing (TRL 3)
- 2023 : Complete America's Phenix/MDS Coating Technologies flight test demonstration of fan blade erosion resistant coating (TRL 7)
- 2023 : Complete GE wind tunnel testing of open fan technology (TRL 5)
- 2024 : Complete Safran Nacelles Acoustic Air Inlet Lip Skin wind tunnel testing (TRL 5)
- 2024 : Complete Boeing Quiet Landing Gear and Quiet High Lift flight test demonstration (TRL 7)
- 2025 : Complete Boeing Intelligent Operations and Next Generation Inlet flight test demonstration (TRL 7)
- 2026 : Complete Pratt & Whitney Ultra Quiet Reduced Loss Fan Stage and TALON X+ Combustor engine test demonstration (TRL 6)
- 2026 : Complete Collins Aerospace large cell exhaust acoustic technology engine test demonstration (TRL 6)
- 2026 : Complete Honeywell Highly Efficient Fan Module, Efficient Green High Pressure Core, and Compact High Work High Lift Low Pressure Turbine engine test demonstration (TRL 6)

### Implementation Approach

The focus of the CLEEN Program is to mature previously conceived noise, emissions and fuel burn reduction technologies from Technology Readiness Levels (TRLs) of 3-5 to TRLs of 6-7 to enable industry to enter product development and expedite introduction of these technologies into current and future civil, aircraft and engines.

#### Benefits

-  Access & Equity
-  Capacity
-  Flexibility
-  Efficiency
-  Environment
-  Predictability
-  Safety

Environment (P): The aim of CLEEN Phase III is to mature and demonstrate new technologies that would reduce fuel consumption, noise and emissions, with potential entry into service beyond 2030.

## Increments/Enabling Activities

**C** [703104-01] Support Qualification and Deployment of Drop-In Alternative Jet Fuels (2021 - 2026)

### Increment Overview

This enabling activity will result in environmental qualification and ASTM International approval of additional advanced alternative fuel blends for their commercial deployment. It will also provide analytical evaluations of the barriers facing alternative fuel deployment and the opportunities their use provide.

### Increment Status

Concept Exploration & Maturation

### Success Criteria

2025 : Identify barriers to the implementation of alternative jet fuels and means to overcome the barriers. Complete analysis to support the evaluation of environmental performance and economic benefits of alternative jet fuels.

2025 : Completed testing and analysis to support qualification and certification by ASTM International of additional alternative jet fuels and adoption by industry.

### Implementation Approach

ASTM International approval is required before alternative jet fuels can be used by commercial aviation. Approval is a vital step to alternative jet fuel deployment. This enabler provides the technical data to support ASTM International approval.

#### Benefits

- Access & Equity
- Capacity
- Flexibility
- Efficiency
- Environment
- Predictability
- Safety

Environment (P): Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change and impact surface air quality.

## Increments/Enabling Activities

**C** [704104-01] Environmental Performance and Targets - Phase III (2021 - 2025)

### Increment Overview

This enabling activity will evaluate additional enhancements to NAS environmental performance relating to noise, emissions, and energy developed during Phase III. Mitigation solutions will be evaluated to understand the potential for aircraft technology, alternative fuels, operations concepts, and policy options to help meet future environmental targets. Results related to energy and climate change will be published on a periodic basis in revisions to the U.S. Aviation Greenhouse Gas Emissions Reduction Plan.

### Increment Status

Concept Exploration & Maturation

### Success Criteria

2025 : Refined quantitative evaluation of progress towards attaining the NextGen environmental goals for noise, emissions and energy with an outlook to 2050 Environmental mitigation solutions are identified. Results relating to energy and emissions affecting climate change are published as a part of revisions to the U.S. Aviation Greenhouse Gas Emissions Reduction Plan.

### Implementation Approach

Outcomes will provide the benefit of developing technological and policy-based solutions and adaptations needed towards to address the shortfalls in environmental performance.

#### Benefits

-  Access & Equity
-  Capacity
-  Flexibility
-  Efficiency
-  Environment
-  Predictability

## Increments/Enabling Activities

**C** [704104-02] Analysis to Support International Environmental Standard-Setting - Phase III (2021 - 2025)

### Increment Overview

This enabling activity provides the scientific and technical basis to support the development and implementation of International Civil Aviation Organization (ICAO) environmental standards (for noise and emissions) and policy measures for commercial aviation during Phase III.

### Increment Status

Concept Exploration & Maturation

### Success Criteria

2025 : Supported the development and implementation of International Civil Aviation Organization (ICAO) environmental standards for noise and emissions, and policy measures.

### Implementation Approach

ICAO/CAEP approved environmental standards and policy measures will be implemented as per internationally agreeable effective date.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Reduce or limit aircraft emissions and noise levels to support environmental sustainability towards meeting FAA environmental goals.

## Stakeholders

Specific roles and responsibilities for the execution of the enabling activities in this portfolio are outlined in the RASCI (Responsible, Accountable, Supportive, Consulted, Informed) . All stakeholder organizations involved in the delivery of the capabilities/enabling activities are listed across the top. Portfolio capabilities are listed on the left side of this table, organized by OI and enabling activity. AEE works with governmental partners such as EPA, NASA, the State Department, and the White House staff to set international ICAO CAEP standards. Fundamental to this work is close coordination and collaboration with industry partners such as airframers (Boeing, Airbus, Bombardier, Embraer, Textron Industries, Gulfstream, Dassault) and engine manufacturers (Pratt & Whitney, GE Aviation, Rolls Royce, Safran, Williams), as well as with organizations such as IATA, ICSA, and ACI. AEDT is being developed by the DOT Volpe Center in conjunction with ATAC Corporation under a contract managed by AEE. AEDT version 2b was released on May 29, 2015. The latest modification of the software is AEDT 2D, released on September 30, 2017. With consultation from ANG-C7, AEE coordinated deployment, guidance, and training with AJM-1, AJM-21, AJM-22, AJM-31, AJM-33, AJV-1, AFS, and ARP. AEDT is also released for use by external stakeholders. In conducting the CLEEN II Program, AEE partners with industry in maturing technologies to reduce aircraft fuel burn, emissions and noise, as well as to advance the introduction of alternative jet fuels. AEE also partners with universities through the ASCENT Center of Excellence in assessing the potential environmental benefits of incorporating CLEEN and CLEEN II technologies into future aircraft and engines. AEE coordinates with other Federal Government agencies involved in research and development of technologies to reduce aircraft fuel burn, emissions and noise, including NASA, Department of Defense and Department of Energy. The FAA works in partnership with industry to promote the development and deployment of alternative jet fuels (AJF) through the Commercial Aviation Alternative Fuels Initiative (CAAFI). The FAA sponsors CAAFI in partnership with Airlines for America (A4A), the Aerospace Industries Association (AIA) and Airports Council International North America (ACI-NA). AEE has established strong partnerships with other Federal agencies including the Departments of Agriculture, Energy and Defense, the EPA, NASA, Department of Commerce, National Science Foundation and State Department. FAA coordinates with our counterparts in other governments and with R&D funding organizations such as the European Commission to share research activities and best practices. We have established bilateral cooperation agreements with Australia, Brazil, Germany, Indonesia and Spain which each have strong alternative jet fuel initiatives. AEE supports ICAO activities to support AFJ including participating in the ICAO CAEP Alternative Fuels Task Force.

- A** Accountable for the completion of NextGen capability. The highest level within the RASCI matrix, this office is charged by the FAA to deliver a particular capability. Typically, this designation is provided via an Acquisition Program Baseline. To foster a clear line of accountability, two different offices can never be Accountable for the same increment, and Accountability can never be delegated to another office.
- R** Responsible for the successful completion of NextGen capability or a critical component of the capability. This office is responsible to the Accountable office. The Responsible office is responsible for initiating an actual change to the NAS such as automation changes, and is often also designated as the Accountable office for that increment. However, there are examples in the NSIP where one office is Accountable for an increment while another office (or offices) is actually making a change in the NAS on behalf of the Accountable office.
- A/R** Accountable for the completion of NextGen capability as well as Responsible for its implementation.
- S** Supports the Responsible office in the implementation of NextGen capability. Typically, this support is in the form of subject matter expertise, procedural guidance, or training activities.
- C** Consulted for input during the implementation of NextGen capability. Provides input on a specific aspect in the development and implementation of a capability, such as safety analysis or approval. Input may or may not be used as determined by the Responsible and Accountable offices.
- I** Informed about the progress of implementation.

## Appendix A

### Alpha Increments

#### Portfolio Overview

The environmental vision for the FAA's strategic plan is to develop and operate a system that reduces aviation's environmental and energy impacts to a level that does not constrain growth and is a model of sustainability. Aircraft noise, air quality, climate, and energy are the most significant potential environmental constraints to increasing aviation capacity, efficiency, and flexibility. Limiting and reducing future aviation environmental impacts to levels that protect public health and welfare as well as ensuring energy availability and sustainability are the guiding principles of aviation environmental protection. The FAA is pursuing the following environmental goals:

**Noise:** Reduce the number of people exposed to significant noise around U.S. airports in absolute terms, notwithstanding aviation growth, and provide additional measures to protect public health and welfare and national resources.

**Air Quality:** Achieve an absolute reduction of significant air quality health and welfare impacts attributable to aviation.

**Climate:** Limit the impact of aircraft carbon dioxide (CO2) emissions on the global climate by achieving carbon-neutral growth by 2020 compared to 2005, and net reductions of the climate impact from all aviation emissions over the longer term (by 2050).

**Energy:** Improve National Airspace System (NAS) energy efficiency and develop and deploy alternative jet fuels for commercial aviation.

To achieve these goals, the FAA's environmental and energy research strategy is based on characterization of the problem and assessment of associated risks; development of technological and policy based solutions; and management of system-wide performance while working closely with stakeholders community. The FAA Office of Environment and Energy is pursuing 5-pillar approach to meet environmental goals (1) Improve scientific knowledge and enhance integrated environmental modeling capability; (2) accelerate maturation of new aircraft technologies; (3) advance alternative jet fuels; (4) explore air traffic management modernization and operational improvements; and (5) develop policies, environmental standards, and market based measures. The Operational Improvements, enabling activities and increments reflect this strategy.

Activities in this portfolio will be conducted in such a way that they do not impact the safety of the NAS. In the Bravo timeframe this portfolio will build on progress from the enabling activities in the Alpha timeframe, which includes Phase 2 maturation of environmentally friendly technologies, fuels, and continued focus on environmental and energy- favorable concepts and operations.

Note: The dates and timelines included in the NAS Segment Implementation Plan (NSIP) are for planning purposes only. All capability schedules are tentative until their supporting programs are officially baselined.

## CO: [703102] Sustainable Alternative Jet Fuels - Phase I (2011 - 2015)

Determine the feasibility and market viability of alternative aviation fuels for commercial aviation use. Obtain ASTM International approval of Hydrotreated Renewable Jet (HRJ) blends and other advanced sustainable fuel blends from renewable resources that are compatible with existing infrastructure and fleet thus meeting requirement to be a "drop in" fuel. It will include multiple increments delivered over time.

### CO Benefit

Environment (P): Reduced emissions.

## Increments/Enabling Activities

**A** [703102-01] Drop-In 50-50% HRJ/HEFA Blend Fuels (2011 - 2011)

### Increment Overview

This enabling activity resulted in ASTM International approval in 2011 of a 50-50 blend of hydroprocessed renewable jet (HRJ)/hydroprocessed esters and fatty acids (HEFA) and Jet-A fuel for use in aviation.

### Increment Status

Complete

### Success Criteria

✔ 2011 : ASTM International approval of 50-50% HRJ/HEFA blend for commercial aviation. This enabling activity has achieved its success criteria.

### Implementation Approach

Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change, air quality and public health.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change, air quality and public health.

## Increments/Enabling Activities

**A** [703102-02] Drop-In >50% HRJ/HEFA Fuels (Greater than 50% Blend) (2015 - 2015)

### Increment Overview

This enabling activity will advance the use, acceptance, and deployment of other HRJ/HEFA blend fuels (>50%) through air quality impact assessments, lifecycle emissions analyses, engine ground tests, and flight demonstrations by 2015.

### Increment Status

Complete

### Success Criteria

✔ 2015 : Complete testing and analysis to support certification and qualification of >50% HRJ/HEFA fuels.

### Implementation Approach

Approval of alternative jet fuels allows the stakeholders community to produce, deploy and use fuels at the commercial scale.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change, air quality and public health.

## Increments/Enabling Activities

**A** [703102-03] Other Advanced Aviation Alternative Fuels - Phase I (2015 - 2015)

### Increment Overview

This enabling activity will explore and qualify additional classes of sustainable aviation alternative fuel blends that use novel feedstocks and conversion processes (e.g., advanced fermentation, alcohol oligomerization, pyrolysis, etc.). Efforts include environmental and performance feasibility through air quality and lifecycle emissions analyses, fuel properties analysis, engine performance evaluation, and ground tests and flight demonstrations by 2015. These efforts will advance deployment of these sustainable alternative fuels, including environmental acceptability and ASTM International approval.

### Increment Status

Complete

### Success Criteria

✓ 2015 : Secure ASTM International approval of additional sustainable aviation alternative fuels beyond HRJ/HEFA blend

### Implementation Approach

Approval of alternative jet fuels allows the stakeholders community to produce, deploy and use fuels at the commercial scale.

## Increments/Enabling Activities

**A** [702102-01] Open Rotor (2012 - 2012)

### Increment Overview

General Electric will mature open rotor technology to Technology Readiness Level (TRL) 5. This technology will reduce fuel burn, emissions, and noise.

### Increment Status

Complete

### Success Criteria

✔ 2012 : Successfully matured and demonstrated at TRL 5. This enabling activity has achieved its success criteria.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

- Access & Equity
- Capacity
- Flexibility
- Efficiency
- Environment
- Predictability
- Safety

Environment (P): GE completed scaled Open Rotor wind tunnel tests. Results indicate aircraft fuel burn on a single aisle aircraft may be reduced 26 percent relative to a CFM International, CFM56-7B engine, and up to 15 dB cumulative noise reduction relative to FAA Stage 4 noise standards. This task has been completed.

## Increments/Enabling Activities

**A** [702102-02] TAPS II Lean Combustor (2012 - 2012)

### Increment Overview

General Electric will mature Twin Annular Pre-Swirl (TAPS) II lean combustor technology to TRL 6. This technology will reduce engine combustion emissions.

### Increment Status

Complete

### Success Criteria

✔ 2012 : Successfully matured and demonstrated at TRL 6. This enabling activity has achieved its success criteria.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): GE completed core engine tests of the TAPS II Combustor. Results show landing and take-off nitrogen oxide (NOx) emissions were reduced 60 percent compared to the International Civil Aviation Organization (ICAO) NOx standard adopted in 2004, meeting one of the CLEEN goals. This task has been completed. This combustor will be used in CFM International's LEAP turbofan engine and is expected to enter service in 2016.

### Increment Overview

Boeing will mature ceramic matrix composite acoustic nozzle technology to TRL 7. This technology will reduce fuel burn, emissions, and noise.

### Increment Status

Complete

### Success Criteria

✔ 2014 : Maturation of technology through flight test demonstration (TRL 7) and its availability for further adoption by industry.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Boeing has developed and demonstrated a Ceramic Matrix Composite (CMC) acoustic nozzle at the engine exhaust. This technology could save aircraft fuel burn up to 1 percent with potential noise reduction capability, the same or better than treated metallic nozzle. CMC nozzle is an enabler for lighter, hotter, more efficient engine and nacelle architectures. This task has been completed.

## Increments/Enabling Activities

**A** [702102-05] Engine Weight Reduction and High-Temperature Impeller (2015 - 2015)

### Increment Overview

Honeywell will mature engine weight reduction and high-temperature impeller technology to TRL 6. This technology will reduce fuel burn, emissions, and noise.

### Increment Status

Complete

### Success Criteria

✔ 2015 : Maturation of technology through ground test demonstration (TRL 6) and its availability for further adoption by industry

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Honeywell has developed and demonstrated technologies that will increase engine efficiency and reduce engine weight. The CLEEN technologies will contribute 5 percent toward an overall 15.7 percent reduction in fuel burn resulting from an engine upgrade relative to baseline engine technology. This requires demonstrating seven technologies including new coatings, higher temperature impeller, advanced seals and improved turbine cooling.

## Increments/Enabling Activities

**A** [702102-06] Flight Management System - Air Traffic Management (FMS-ATM) Integration (2015 - 2015)

### Increment Overview

General Electric will mature FMS-ATM technology to TRL 6. This technology will reduce fuel burn and emissions and, potentially, noise.

### Increment Status

Complete

### Success Criteria

✔ 2015 : Maturation of technology through ground test demonstration (TRL 6) and its availability for further adoption by industry.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): GE has developed and demonstrated Flight Management System (FMS) - Air Traffic Management (ATM) Trajectory Optimization technology to control the aircraft location in three spatial coordinates and time (4D). This approach will optimize speed, altitude, and lateral path in order to determine the most efficient trajectory to minimize fuel burn and emissions given weather and flow management constraints. This system is linked directly to each aircraft in the fleet via the communications interface (ACARS) of FMS. GE has also developed and demonstrated FMS-Engine integration technology which will reduce aircraft fuel burn through efficiencies gained by adaptive engine control, integrated vehicle health management, and integrated flight-propulsion control. Engine ground testing will be conducted in 2015. Estimated benefits of the FMS Engine Integration technologies are an approximately 1 percent reduction in fuel burn.

## Increments/Enabling Activities

**A** [702102-08] Ceramic Matrix Composite Turbine Blade Tracks (2017 - 2017)

### Increment Overview

Rolls-Royce will mature ceramic matrix composite turbine blade tracks technology to TRL 6. This technology will reduce fuel burn and emissions.

### Increment Status

Complete

### Success Criteria

✔ 2014 : Maturation of technology through ground test demonstration (TRL 6) and its availability for further adoption by industry.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Rolls-Royce has developed and demonstrated Ceramic Matrix Composite (CMC) Blade Track, technology aimed at increasing thermal efficiency in turbine section of the engine. The new blade tracks made from CMC material are projected to offer more than a 50 percent reduction in engine cooling and weight savings compared to a metallic design. Rolls Royce's Dual-Wall Turbine Airfoil and CMC Turbine Blade Track technology will together realize up to a 1 percent reduction in fuel burn for Rolls-Royce's next-generation civil products. Further benefits are attainable through incorporation of this technology in advanced engine cycles.

## Increments/Enabling Activities

**A** [701102-01] Aviation Environmental Design Tool Version 2A (2012 - 2012)

### Increment Overview

The Aviation Environmental Design Tool (AEDT) will provide capabilities for integrated environmental analysis at regional levels for fuel burn, emissions, and noise.

The software was released on March 21, 2012, and also was released for use by external stakeholders.

### Increment Status

Complete

### Success Criteria

✔ 2012 : Public release of AEDT Version 2A. This enabling activity has achieved its success criteria.

### Implementation Approach

Released AEDT to FAA-internal and external (both domestic and international) stakeholders for integrated environmental analyses.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P). AEDT is used to perform regional integrated (noise, emissions and fuel burn) environmental analyses for airspace management planning, to meet environmental compliance and regulatory requirements as well as to track, report and project future system wide environmental performance, and to guide and evaluate benefit of technological and policy options.

## Increments/Enabling Activities

**A** [704102-02] NEPA Strategy and Processes - Phase I (2013 - 2013)

### Increment Overview

This enabling activity establishes effective strategic approaches for addressing the NEPA requirements of NextGen improvements. This includes applying best practices to minimize redundancy of analyses and maximizing efficiencies of time and cost. When necessary, it will outline an approach for integrating NEPA considerations into existing FAA guidance at key decision points, such as the Acquisition Management System (AMS) and Systems Engineering Manual (SEM), to ensure appropriate consideration is given early in the planning phase.

### Increment Status

Complete

### Success Criteria

✔ 2013 : Improvements in guidance, best practices, collaborating/coordinating, resource use/training, and implementation following initial NEPA review. This enabling activity has achieved its success criteria.

### Implementation Approach

AEE developed strategic approaches for addressing the NEPA requirements of NextGen improvements. AEE coordinated with ANG and other organizations to ensure integration of NEPA considerations and processes in Acquisition Management System (AMS) and NAS System Engineering Manual (SEM).

### Benefits

- Access & Equity
- Capacity
- Flexibility

## Increments/Enabling Activities

**A** [704102-03] Environmental Targets (2014 - 2015)

### Increment Overview

This enabling activity will explore, test, and refine quantitative NextGen environmental targets for noise, air quality, climate, and energy.

### Increment Status

Complete

### Success Criteria

✓ 2015 : Refined quantitative evaluation of progress towards attaining the NextGen goals for noise, air quality, climate, and energy.

### Implementation Approach

Outcomes will inform technological and policy based actions and adaptations needed towards addressing the shortfalls through implementation under other operational improvements.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Finding of regular analysis under this incremental operational improvement will assess the progress being made towards meeting the FAA environmental goals and identify the potential shortfalls.

### System Interactions

## Increments/Enabling Activities

**A** [704102-05] Analysis to Support International Environmental Standard-Setting - Phase I (2015 - 2015)

### Increment Overview

This enabling activity addresses analysis and benefit assessment to support the development and implementation of the U.S. Aviation Greenhouse Gas Emissions Reduction Plan and International Civil Aviation Organization (ICAO) environmental standards, such as for aircraft CO2 emissions and more stringent noise levels.

### Increment Status

Complete

### Success Criteria

✓ 2015 : Acceptance and use of analysis to inform US position on international decision-making on aircraft emissions and noise standards.

### Implementation Approach

ICAO/CAEP approved environmental standards and stringency levels will be implemented for aircraft certification as per the internationally agreeable effective date.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Reduce or limit aircraft emissions and noise levels to support environmental sustainability towards meeting FAA environmental goals.

## Increments/Enabling Activities

**A** [704102-06] Environmental Goals and Targets Performance Tracking System (2015 - 2015)

### Increment Overview

A system will be established that will support the systematic identification of environmental benefits across the NAS, enabling the FAA to measure progress toward achieving NextGen environmental goals. This system may include business practices, automation capabilities, and interfaces with other automation systems.

### Increment Status

Complete

### Success Criteria

✔ 2015 : Release of NextGen EMS webportal for environmental data exchange with stakeholders to aid performance tracking of the system.

### Implementation Approach

Through development and release of webportal for communication, outreach, data and information exchange.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Performance tracking system through webportal will collect the communitywideenvironmental relevant data.

# Environment and Energy

## Systems Interactions

The FAA aims to develop and operate a system that reduces aviation's environmental and energy impacts to a level that does not constrain growth and is a model of sustainability. These goals include limiting the impact of aircraft carbon dioxide (CO<sub>2</sub>) emissions on the global climate by achieving carbon-neutral growth by 2035, and net reductions of the climate impact from all aviation emissions over the longer term (by 2050). Reduce the number of people exposed to significant noise around U.S. airports. Improve National Airspace System (NAS) energy efficiency and develop and deploy alternative jet fuels for commercial aviation. Achieve an absolute reduction of significant air quality health and welfare impacts attributable to aviation

## Stakeholders

Specific roles and responsibilities for the execution of the enabling activities in this portfolio are outlined in the RASCI (Responsible, Accountable, Supportive, Consulted, Informed) . All stakeholder organizations involved in the delivery of the capabilities/enabling activities are listed across the top. Portfolio capabilities are listed on the left side of this table, organized by OI and enabling activity. AEE works with governmental partners such as EPA, NASA, the State Department, and the White House staff to set international ICAO CAEP standards. Fundamental to this work is close coordination and collaboration with industry partners such as airframers (Boeing, Airbus, Bombardier, Embraer, Textron Industries, Gulfstream, Dassault) and engine manufacturers (Pratt & Whitney, GE Aviation, Rolls Royce, Safran, Williams), as well as with organizations such as IATA, ICSA, and ACI. AEDT is being developed by the DOT Volpe Center in conjunction with ATAC Corporation under a contract managed by AEE. AEDT version 2b was released on May 29, 2015. The latest modification of the software is AEDT 2D, released on September 30, 2017. With consultation from ANG-C7, AEE coordinated deployment, guidance, and training with AJM-1, AJM-21, AJM-22, AJM-31, AJM-33, AJV-1, AFS, and ARP. AEDT is also released for use by external stakeholders. In conducting the CLEEN II Program, AEE partners with industry in maturing technologies to reduce aircraft fuel burn, emissions and noise, as well as to advance the introduction of alternative jet fuels. AEE also partners with universities through the ASCENT Center of Excellence in assessing the potential environmental benefits of incorporating CLEEN and CLEEN II technologies into future aircraft and engines. AEE coordinates with other Federal Government agencies involved in research and development of technologies to reduce aircraft fuel burn, emissions and noise, including NASA, Department of Defense and Department of Energy. The FAA works in partnership with industry to promote the development and deployment of alternative jet fuels (AJF) through the Commercial Aviation Alternative Fuels Initiative (CAAFI). The FAA sponsors CAAFI in partnership with Airlines for America (A4A), the Aerospace Industries Association (AIA) and Airports Council International North America (ACI-NA). AEE has established strong partnerships with other Federal agencies including the Departments of Agriculture, Energy and Defense, the EPA, NASA, Department of Commerce, National Science Foundation and State Department. FAA coordinates with our counterparts in other governments and with R&D funding organizations such as the European Commission to share research activities and best practices. We have established bilateral cooperation agreements with Australia, Brazil, Germany, Indonesia and Spain which each have strong alternative jet fuel initiatives. AEE supports ICAO activities to support AFJ including participating in the ICAO CAEP Alternative Fuels Task Force.

- A** Accountable for the completion of NextGen capability. The highest level within the RASCI matrix, this office is charged by the FAA to deliver a particular capability. Typically, this designation is provided via an Acquisition Program Baseline. To foster a clear line of accountability, two different offices can never be Accountable for the same increment, and Accountability can never be delegated to another office.
- R** Responsible for the successful completion of NextGen capability or a critical component of the capability. This office is responsible to the Accountable office. The Responsible office is responsible for initiating an actual change to the NAS such as automation changes, and is often also designated as the Accountable office for that increment. However, there are examples in the NSIP where one office is Accountable for an increment while another office (or offices) is actually making a change in the NAS on behalf of the Accountable office.
- A/R** Accountable for the completion of NextGen capability as well as Responsible for its implementation.
- S** Supports the Responsible office in the implementation of NextGen capability. Typically, this support is in the form of subject matter expertise, procedural guidance, or training activities.
- C** Consulted for input during the implementation of NextGen capability. Provides input on a specific aspect in the development and implementation of a capability, such as safety analysis or approval. Input may or may not be used as determined by the Responsible and Accountable offices.
- I** Informed about the progress of implementation.

# Environment and Energy

## Appendix B

### Bravo Increments

#### Portfolio Overview

The environmental vision for the FAA's strategic plan is to develop and operate a system that reduces aviation's environmental and energy impacts to a level that does not constrain growth and is a model of sustainability. Aircraft noise, air quality, climate, and energy are the most significant potential environmental constraints to increasing aviation capacity, efficiency, and flexibility. Limiting and reducing future aviation environmental impacts to levels that protect public health and welfare as well as ensuring energy availability and sustainability are the guiding principles of aviation environmental protection. The FAA is pursuing the following environmental goals:

**Noise:** Reduce the number of people exposed to significant noise around U.S. airports in absolute terms, notwithstanding aviation growth, and provide additional measures to protect public health and welfare and national resources.

**Air Quality:** Achieve an absolute reduction of significant air quality health and welfare impacts attributable to aviation.

**Climate:** Limit the impact of aircraft carbon dioxide (CO2) emissions on the global climate by achieving carbon-neutral growth by 2020 compared to 2005, and net reductions of the climate impact from all aviation emissions over the longer term (by 2050).

**Energy:** Improve National Airspace System (NAS) energy efficiency and develop and deploy alternative jet fuels for commercial aviation.

To achieve these goals, the FAA's environmental and energy research strategy is based on characterization of the problem and assessment of associated risks; development of technological and policy based solutions; and management of system-wide performance while working closely with stakeholders community. The FAA Office of Environment and Energy is pursuing 5-pillar approach to meet environmental goals (1) Improve scientific knowledge and enhance integrated environmental modeling capability; (2) accelerate maturation of new aircraft technologies; (3) advance alternative jet fuels; (4) explore air traffic management modernization and operational improvements; and (5) develop policies, environmental standards, and market based measures. The Operational Improvements, enabling activities and increments reflect this strategy.

Activities in this portfolio will be conducted in such a way that they do not impact the safety of the NAS. In the Bravo timeframe this portfolio will build on progress from the enabling activities in the Alpha timeframe, which includes Phase 2 maturation of environmentally friendly technologies, fuels, and continued focus on environmental and energy- favorable concepts and operations.

Note: The dates and timelines included in the NAS Segment Implementation Plan (NSIP) are for planning purposes only. All capability schedules are tentative until their supporting programs are officially baselined.

## Increments/Enabling Activities

**B** [702102-07] Ultra High-Bypass Ratio Geared Turbo Fan (2015 - 2017)

### Increment Overview

Pratt & Whitney will mature ultra high-bypass ratio geared turbo fan technology to TRL 6. This technology will reduce fuel burn, emissions, and noise.

### Increment Status

Complete

### Success Criteria

✔ 2017 : Maturation of technology through ground test demonstration (TRL 6) and its availability for further adoption by industry.

### Implementation Approach

Transfer of technology to industry for further maturation and commercial deployment.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Pratt & Whitney is developing and demonstrating an ultra-high bypass ratio geared turbofan (GTF) engine and associated advanced technologies. Geared turbofan engine technologies will contribute to reduced aircraft noise and fuel consumption because of increased engine efficiency. This engine is projected to reduce single aisle aircraft fuel consumption by 20 percent relative to a CFM International, CFM56-7 engine and 25 dB noise reduction relative to the Stage 4 noise standards.

### System Interactions

## Increments/Enabling Activities

**B** [701103-01] Aviation Environmental Tools Suite (2016 - 2020)

### Increment Overview

Develop, evaluate, and implement enhancements in an aviation environmental suite of tools for aircraft level to NAS-wide modeling and analyses to inform development of mitigation solutions and policy options that will further improve scientific knowledge, refine metrics, and reduce uncertainties of aircraft source-level noise and emissions of air pollutants and greenhouse gases, their atmospheric evolution, and impacts on human health and welfare and climate change.

### Increment Status

Complete

### Success Criteria

- ✓ 2016 : Release Aviation Environmental Design Tool (AEDT) Version 2c
- ✓ 2018 : Release Aviation Environmental Design Tool (AEDT) Version 3 with improved noise, emissions, and fuel burn estimation methodologies
- ✓ 2020 : Use of advanced scientific understanding of aviation noise and emissions and their impacts, to enhance capability of environmental assessment models to assess environmental performance and benefits of mitigation options.

### Implementation Approach

Release enhanced versions of AEDT and develop additional analytical capabilities to support decision-making, environmental performance assessments, and cost-benefit analyses.

#### Benefits

- Access & Equity
- Capacity
- Flexibility
- Efficiency
- Environment
- Predictability
- Safety

Environment (P): Integrated advancement in scientific knowledge and environmental analytical tools capability will provide solid foundation for environmental mitigation (technological and policy based) decision-making and assessment studies.

### System Interactions

## CO: [702103] NextGen Environmental Engine and Aircraft Technologies - Phase II (2016 - 2022)

Support certification and commercialization of aircraft technologies for enhanced environmental and energy efficiency improvements demonstrated during Phase I. Demonstrate additional technologies meeting CLEEN goals, including wing laminar flow, advanced aircraft noise reduction, and a lower drag vertical tail. It will include multiple increments delivered over time.

### CO Benefit

Environment (P): Reduce emissions, fuel burn, and noise.

## Increments/Enabling Activities

**B** [702103-03] Explore and Demonstrate New Technologies Under CLEEN - Phase II (2016 - 2022)

### Increment Overview

This enabling activity will explore and demonstrate new technologies in CLEEN Phase II.

### Increment Status

Complete

### Success Criteria

- ✓ 2018 : Double-Bubble Aircraft Fuselage (TRL 5)
- ✓ 2018 : Compact Nacelle (TRL 6)
- ✓ 2019 : Structurally Efficient Wing (TRL 6)
- ✓ 2019 : Flight Management System/Engine Integration (TRL 6)
- ✓ 2020 : Leading Edge Protective Coating (TRL 7)
- ✓ 2020 : Turbine Aero-Efficiency Technologies (TRL 6)
- ✓ 2020 : TAPS III Combustor (TRL 6)
- ✓ 2020 : Advanced Turbine Blade Outer Air Seal Systems (TRL 6)
- ✓ 2020 : Compact Combustor (TRL 6)
- ✓ 2020 : Advanced Rich Quench Lean (RQL) Low NOx Combustor (TRL 6)
- ✓ 2020 : More Electric Systems and Technologies for Aircraft in the Next Generation (MESTANG) (TRL 6)
- ✓ 2021 : Flight test of compact nacelle aft duct acoustics technology (TRL 7)
- ✓ 2022 : Engine test of compact high pressure compressor and advanced acoustics fan technologies (TRL 6)

### Implementation Approach

The focus of the CLEEN Program is to mature previously conceived noise, emissions and fuel burn reduction technologies from Technology Readiness Levels (TRLs) of 3-5 to TRLs of 6-7 to enable industry to enter product development and expedite introduction of these technologies into current and future civil, aircraft and engines.

#### Benefits

-  Access & Equity
-  Capacity
-  Flexibility
-  Efficiency
-  Environment
-  Predictability
-  Safety

Environment (P): The aim of CLEEN II is to mature and demonstrate new technologies that would reduce fuel consumption, noise and emissions, with potential entry into service by 2026.

## OI: [703103] Sustainable Alternative Jet Fuels - Phase II (2016 - 2020)

Obtain ASTM International approval of additional advanced "drop-in" sustainable alternative fuels. These advanced "drop-in" fuels should reduce fuel production cost, reduce environmental impacts, improve energy security, and enable carbon neutral growth by 2020. It will include multiple increments delivered over time.

### OI Benefit

Environment (P): Reduced emissions.

## Increments/Enabling Activities

**B** [703103-01] Other Advanced Drop-In Aviation Alternative Jet Fuels - Phase II (2016 - 2020)

### Increment Overview

This enabling activity will result in ASTM International approval of additional advanced alternative fuel blends for use by the commercial fleet. Fuel types may include renewable jet fuel from fermentation, pyrolysis, catalysis, and other processes. ASTM International approval is required before alternative jet fuels can be used by commercial aviation. Approval is a vital step to alternative jet fuel deployment.

### Increment Status

Complete

### Success Criteria

- ✓ 2018 : ASTM International added ethanol as an approved feedstock in ASTM D7566 Annex A5.
- ✓ 2020 : Complete testing and analysis to support qualification and certification by ASTM International of additional alternative jet fuels and adoption by industry.

### Implementation Approach

ASTM International approval is required before alternative jet fuels can be used by commercial aviation. Approval is a vital step to alternative jet fuel deployment. This enabler provides the technical data to support ASTM International approval.

#### Benefits

- Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change and impact surface air quality.

## Increments/Enabling Activities

**B** [703103-02] Generic Methodology for Alternative Jet Fuel Approval (2016 - 2020)

### Increment Overview

This enabling activity will develop a generic bulk chemical composition based methodology that ASTM International could use to aid the approval process of alternative jet fuels.

### Increment Status

Complete

### Success Criteria

✔ 2020 : Developed generic testing and modelling capabilities for screening of potential alternative jet fuels candidates in support of ASTM International approval.

### Implementation Approach

Transfer of the methodology to industry and/or ASTM International to aid the approval of new alternative jet fuels for use by commercial aviation.

#### Benefits

 Access & Equity  Capacity  Flexibility  Efficiency  Environment  Predictability  Safety

Environment (P): Alternative jet fuels offer benefits through reduction in aircraft combustion emissions and fuel lifecycle greenhouse gas emissions that contribute to global climate change and impact surface air quality.

## Increments/Enabling Activities

**B** [704103-01] Environmental Performance and Targets - Phase II (2016 - 2020)

### Increment Overview

This enabling activity will evaluate NAS environmental performance relating to noise, emissions, and energy. Mitigation solutions will be evaluated to understand the potential for aircraft technology, alternative fuels, operations concepts, and policy options to help meet future environmental targets. Results related to energy and climate change will be published on a periodic basis in revisions to the U.S. Aviation Greenhouse Gas Emissions Reduction Plan.

### Increment Status

Complete

### Success Criteria

✔ 2018 : Refined quantitative evaluation of progress towards attaining the NextGen environmental goals for noise, emissions, and energy with an outlook to 2050. Environmental mitigation solutions are identified.

### Implementation Approach

Outcomes will provide the benefit of developing technological and policy-based solutions and adaptations needed towards to address the shortfalls in environmental performance.

#### Benefits

- Access & Equity
- Capacity
- Flexibility
- Efficiency
- Environment
- Predictability
- Safety

Environment (P): Findings of regular analysis under this incremental operational improvement will assess the progress being made towards meeting the FAA environmental goals and identify the potential shortfalls.

## Increments/Enabling Activities

**B** [704103-03] EMS Data Management (2016 - 2020)

### Increment Overview

This enabling activity will address cross-cutting environmental challenges to facilitate NextGen EMS implementation for select capabilities with environmental and energy aspects by establishing, where appropriate, approaches, programs, and processes for working closely with stakeholders (e.g. manufacturers, airlines, airports) to develop approaches to enhance environmental benefits or reduce negative impacts, develop effective efficient approaches to address NEPA requirements, and to track environmental performance resulting from the implementation of capabilities.

### Increment Status

Complete

### Success Criteria

✔ 2016 : Provided the Environment and Energy Strategy

### Implementation Approach

Implementation through environmental data exchange and communication.

#### Benefits

## Increments/Enabling Activities

**B** [704103-04] Analysis to Support International Environmental Standard-Setting - Phase II (2016 - 2020)

### Increment Overview

This enabling activity provides the scientific and technical basis to support the development and implementation of International Civil Aviation Organization (ICAO) environmental standards, such as particulate matter emissions, and policy measures for commercial aviation.

### Increment Status

Complete

### Success Criteria

- ✓ 2016 : Supported the development and implementation of International Civil Aviation Organization (ICAO) environmental standard for CO2 emissions.
- ✓ 2019 : Supported the development and implementation of International Civil Aviation Organization (ICAO) global market based measure for international CO2 emissions.
- ✓ 2019 : Supported the development and implementation of International Civil Aviation Organization (ICAO) environmental standard for particulate matter emissions.

### Implementation Approach

ICAO/CAEP approved environmental standards and policy measures will be implemented as per internationally agreeable effective date.

#### Benefits

Access & Equity Capacity Flexibility Efficiency Environment Predictability Safety

Environment (P): Reduce or limit aircraft emissions and noise levels to support environmental sustainability towards meeting FAA environmental goals.

# Environment and Energy

## Systems Interactions

The FAA aims to develop and operate a system that reduces aviation's environmental and energy impacts to a level that does not constrain growth and is a model of sustainability. These goals include limiting the impact of aircraft carbon dioxide (CO<sub>2</sub>) emissions on the global climate by achieving carbon-neutral growth by 2035, and net reductions of the climate impact from all aviation emissions over the longer term (by 2050). Reduce the number of people exposed to significant noise around U.S. airports. Improve National Airspace System (NAS) energy efficiency and develop and deploy alternative jet fuels for commercial aviation. Achieve an absolute reduction of significant air quality health and welfare impacts attributable to aviation

## Stakeholders

Specific roles and responsibilities for the execution of the enabling activities in this portfolio are outlined in the RASCI (Responsible, Accountable, Supportive, Consulted, Informed) . All stakeholder organizations involved in the delivery of the capabilities/enabling activities are listed across the top. Portfolio capabilities are listed on the left side of this table, organized by OI and enabling activity. AEE works with governmental partners such as EPA, NASA, the State Department, and the White House staff to set international ICAO CAEP standards. Fundamental to this work is close coordination and collaboration with industry partners such as airframers (Boeing, Airbus, Bombardier, Embraer, Textron Industries, Gulfstream, Dassault) and engine manufacturers (Pratt & Whitney, GE Aviation, Rolls Royce, Safran, Williams), as well as with organizations such as IATA, ICSA, and ACI. AEDT is being developed by the DOT Volpe Center in conjunction with ATAC Corporation under a contract managed by AEE. AEDT version 2b was released on May 29, 2015. The latest modification of the software is AEDT 2D, released on September 30, 2017. With consultation from ANG-C7, AEE coordinated deployment, guidance, and training with AJM-1, AJM-21, AJM-22, AJM-31, AJM-33, AJV-1, AFS, and ARP. AEDT is also released for use by external stakeholders. In conducting the CLEEN II Program, AEE partners with industry in maturing technologies to reduce aircraft fuel burn, emissions and noise, as well as to advance the introduction of alternative jet fuels. AEE also partners with universities through the ASCENT Center of Excellence in assessing the potential environmental benefits of incorporating CLEEN and CLEEN II technologies into future aircraft and engines. AEE coordinates with other Federal Government agencies involved in research and development of technologies to reduce aircraft fuel burn, emissions and noise, including NASA, Department of Defense and Department of Energy. The FAA works in partnership with industry to promote the development and deployment of alternative jet fuels (AJF) through the Commercial Aviation Alternative Fuels Initiative (CAAFI). The FAA sponsors CAAFI in partnership with Airlines for America (A4A), the Aerospace Industries Association (AIA) and Airports Council International North America (ACI-NA). AEE has established strong partnerships with other Federal agencies including the Departments of Agriculture, Energy and Defense, the EPA, NASA, Department of Commerce, National Science Foundation and State Department. FAA coordinates with our counterparts in other governments and with R&D funding organizations such as the European Commission to share research activities and best practices. We have established bilateral cooperation agreements with Australia, Brazil, Germany, Indonesia and Spain which each have strong alternative jet fuel initiatives. AEE supports ICAO activities to support AFJ including participating in the ICAO CAEP Alternative Fuels Task Force.

- A** Accountable for the completion of NextGen capability. The highest level within the RASCI matrix, this office is charged by the FAA to deliver a particular capability. Typically, this designation is provided via an Acquisition Program Baseline. To foster a clear line of accountability, two different offices can never be Accountable for the same increment, and Accountability can never be delegated to another office.
- R** Responsible for the successful completion of NextGen capability or a critical component of the capability. This office is responsible to the Accountable office. The Responsible office is responsible for initiating an actual change to the NAS such as automation changes, and is often also designated as the Accountable office for that increment. However, there are examples in the NSIP where one office is Accountable for an increment while another office (or offices) is actually making a change in the NAS on behalf of the Accountable office.
- A/R** Accountable for the completion of NextGen capability as well as Responsible for its implementation.
- S** Supports the Responsible office in the implementation of NextGen capability. Typically, this support is in the form of subject matter expertise, procedural guidance, or training activities.
- C** Consulted for input during the implementation of NextGen capability. Provides input on a specific aspect in the development and implementation of a capability, such as safety analysis or approval. Input may or may not be used as determined by the Responsible and Accountable offices.
- I** Informed about the progress of implementation.
